

Our philosophy for afforestation and combating desertification is quite different from other researchers in the following six points.

- 1) Creation of a non-toxic root growth promoter that draws the intrinsic growth ability of plant.
- 2) Never destroy natural vegetation. Employment of the native grasses and plants only.
- 3) Get water from rain, under natural conditions.
- 4) Banning the use of a polymer as water absorbent.
- 5) Never handle native soil with ameliorant, soil conditioner, soil improvement agent.
- 6) Creation of a breeding drug for goats. The drug achieves the increase in the cashmere-growth at the same time.
